RESEARCH INTERESTS AND CURRENT PROJECTS

My research has focussed on pure mathematics for 10 years. As I have always been interested in mathematics education, two years ago I switched to STEM education. I am interested in methods that improve teaching and learning in STEM domains. In particular, I am interested in how to awaken curiosity for STEM domains in children and young adults and get them passionate about it. Sciences and mathematics are often, from a very young age on, taught as dogmatic and right-or-wrong subjects, whereas they are exactly the contrary. In my projects I aim at changing this and give impetus for different teaching methods.

PITT - Programme for Innovative Teaching and Training

With an interdisciplinary team of teachers and researchers from the fields of didactics, educational science, psychology, sociology, mathematics and German studies, we provide practical examples that give innovative impulses for contemporary teaching in Luxembourg's secondary schools. The PITT teaching modules are intended as incentives to try out new things and to think differently and digitally about teaching.

It is not about presenting something ready-made and self-contained. Rather, the teaching modules are suggestions and proposals for discussion. We are pursuing a cooperative approach where the teachers' feedback is particularly important.

Each year, PITT focuses on a different school subject. During the last two years, we have developed modules for the Digital Sciences course. Now we are working on modules for the mathematics course in the second year of Luxembourgish high school. This is a joint project with Dr. I. Baumann, S. Baumann, Dr. D. Harion and Dr. T. Lenz, www.pitt.lu.

Statistical Literacy

In this project, we are interested in how to familiarize high school pupils with basic statistics at a very young age. The goal is not to develop a statistics class, but rather to link basic statistical concepts to real life examples that are interesting to young people. By basic statistical concepts, we mean reading and interpreting diagrams and graphs, understanding correlation, causality and bias. We are interested in seeing in how far pupils can get a feeling and understanding for these notions when discovering them not in a typical math course, but encountering them while trying to understand some real life example. This is a joint project with Prof. C. Ley and Dr. K. Mai Huy.

Mathematical Story Telling

This project is an interdisciplinary project between the French class and the math class. Together with Dr. M. Lhuissier, we have written two beginnings of a story, in French language. Pupils can choose one story and have to complete it, by inventing and writing down an ending to the story. Every story contains a plot-twist involving a mathematical reasoning. To continue the story, pupils are forced to do some minimal calculations and come to terms with the mathematical theory. We are interested in seeing how the mathematical reasoning can be stimulated when linked to story telling. Moreover it is interesting to see if some pupil's interest for mathematics will be reflected in the way he or she completes the story.
